

Scared of the Dark? You're Not Alone. Fear Handed Down From Cavemen Ancestors Causes On-Road Stress; This New Tech Could Help

- Night fears rooted in our pre-historic past cause stress behind the wheel; new poll shows most people worry about night blindness, many fear hitting pedestrians. After dark, traffic accidents with pedestrians can be almost twice as likely to lead to a fatality
- Ford introduces tech that can automatically brake for pedestrians at night; the system scans the road ahead – and pavement for people who might step into the road
- Later this year, the technology will be introduced on the next-generation Fiesta in Europe. In North America, the new technology will debut on the 2018 Ford F-150 and 2018 Ford Mustang

COLOGNE, Germany, March 16, 2017 – It's not just children who are afraid of the dark. Whether preferring to sleep with a light on – or worrying about driving at night – [grown-ups get scared too](#).

Some experts believe fear of the dark, or nyctophobia, can be traced back to our cave-dwelling ancestors, [who were more at risk of being attacked by predators in the dark](#). Today it affects us behind the wheel.

Worries over night blindness, and fear of hitting someone – or something – top a new poll of night-time driving fears, commissioned by Ford. * And for the latter at least, there is now a solution that goes beyond simply eating more carrots. The company is for the first time introducing new technology that is designed to detect pedestrians at night and then automatically apply the brakes if the driver does not respond to initial warnings.

“We know some drivers find hitting the road at night a stressful experience. Especially driving in towns and cities, pedestrians – sometimes distracted by mobiles – can without warning step into the road, leaving even alert drivers very little time to avoid an accident,” said Gregor Alexi, active safety engineer, Ford of Europe. “Day and night, Pedestrian Detection is designed to help identify people already in – or about to step into – the road ahead.”

Of thousands of drivers surveyed across Europe, 81 per cent admit to being scared on the roads at night, rising to 87 per cent for women. More than half say poor night vision is a source of stress, and more than a third worry they might be involved in an accident. Fears that they may hit a pedestrian were highlighted by one in five drivers surveyed.

This is a global issue. In 2014, across Europe, more than 1 in 5 road fatalities were pedestrians, almost half of whom died following accidents that occurred after dark. ** In the U.S. in 2015, [3 in 4 motor-vehicle related pedestrian deaths happened during dark hours](#), according to the National Highway Traffic Safety Administration.

For the improved Pedestrian Detection technology, now able to work at night for the first time, the development team worked at night, sending life-sized dummies into the path of vehicles on closed tracks, and testing the system on public roads in busy cities including Paris and Amsterdam.

How it works

Pedestrian Detection processes information from a radar located in the bumper, and a windshield-mounted camera; while a database of “pedestrian shapes” enables the system to distinguish people from objects such as trees and road signs. The camera delivers more than 30 snapshots every second – faster than a cinema projector. The video live-feed and viewing angle enables the system to pick out pedestrians, even in low-light conditions, illuminated only by the headlights.

If the system detects an imminent collision with a pedestrian, it first provides audible and visual warnings to the driver. Should the driver not respond, the system automatically applies the brakes. Later this year, the more advanced Pedestrian Detection technology will be introduced on the [next generation Fiesta](#) in Europe – currently on show at the Geneva Motor Show. In North America, the new technology will debut first on the 2018 Ford F-150 and 2018 Ford Mustang.

Driving at night hacks:

Here are a few ways to make driving at night easier:

- Ensure windows and mirrors are clean and free of ice and condensation
- Clean all exterior lights and check they work, keep spare bulbs in the car
- On unlit roads, put headlights on full beam and dip them on seeing oncoming vehicles
- Don't drive tired or for more than two hours without a break
- Schedule regular optician appointments to check your vision

About Ford Motor Company

Ford Motor Company (NYSE: F) is a global company based in Dearborn, Michigan. The company designs, manufactures, markets and services a full line of Ford trucks, utility vehicles, and cars – increasingly including electrified versions – and Lincoln luxury vehicles; provides financial services through Ford Motor Credit Company; and is pursuing leadership positions in electrification; mobility solutions, including self-driving services; and connected vehicle services. Ford employs approximately 186,000 people worldwide. For more information regarding Ford, its products and Ford Motor Credit Company, please visit corporate.ford.com.

Ford of Europe

Ford of Europe is responsible for producing, selling and servicing Ford brand vehicles in 50 individual markets and employs approximately 52,000 employees at its wholly owned facilities and approximately 68,000 people when joint ventures and unconsolidated businesses are included. In addition to Ford Motor Credit Company, Ford Europe operations include Ford Customer Service Division and 24 manufacturing facilities (16 wholly owned or consolidated joint venture facilities and 8 unconsolidated joint venture facilities). The first Ford cars were shipped to Europe in 1903 – the same year Ford Motor Company was founded. European production started in 1911.
